

## Private Server Solution Released

Nixperience has [announced](#) the release of NixVPS, a virtual private server solution, last week. The solution helps SME/ SMBs and a web host provider harness the functionality of a dedicated server at a low cost and provides a robust and sturdy virtualization environment.

Talking to CXOlinux, Roy Ong of Nixperience said that developing the server solution was a fairly good experience.

"Moving away from the pre-compiled XEN binaries was decision that was made right from the onset and with the experience and inside knowledge gained, we were able to develop a set of automated scripts to help us in the deployment, maintenance, updating and patching of all guest and host kernels. This minimizes the tedious administrative tasks that seem to hog most VPS solutions," said Ong

Added Ong, "Our solutions are available to potential clients all around the world. Our servers are located Singtel ComCentre III - a premier data-center with extensive links and bandwidth around the world. This extensive bandwidth and connection links provide Nixperience with the viable platform in which to base our solutions."

Customers gain access to their NixVPS solutions via a remote connection over an encrypted tunnel and are able to deploy a variety of solutions to their customers, colleagues and remote offices around the world.

"At present, we do not employ individual pricing strategies for each continent. With rapidly changing technology advanced business environment, we believe in price transparency. Our prices are kept competitive because of this transparency and have only deployed a 2- tier, reseller and end-user pricing mechanism, valid for all parts of the world," pointed Ong.

"Since the beginning of the year, Nixperience has been releasing solutions based on a specific niche business need and we intend to follow through with a similar strategy. In the coming months, we will be consolidating and refining our existing solutions, while at the same time, customers may look forward to the next solution release in the area of encrypted data storage," concluded Ong.
